

### Classification of Gymnosperms:

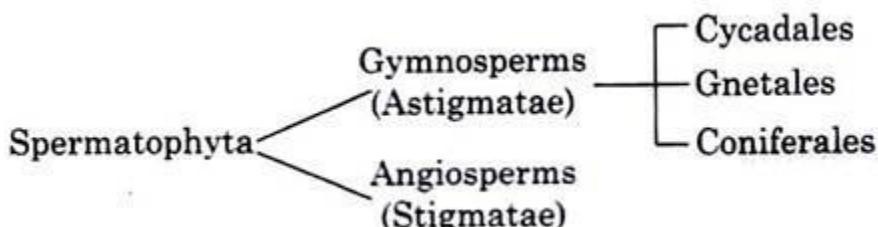

The group Gymnosperms is a very large class which includes both living and fossil forms. Due to ample records of fossil forms the classification has become somewhat complicated. In older times gymnosperms were kept among angiosperms. It was Robert Brown (1827) who first of all recognised these plants due to presence of naked ovules and placed them in a distinct group called gymnosperms. Bentham and Hooker (1862-83) in their 'Genera Plantarum' placed this group in between dicotyledonae and monocotyledonae.

The classification of gymnosperms is quite controversial because several genera and a few orders like the cordaitales and cycadeoidales are known only in fossil state. Several workers have classified Gymnosperms differently from time to time. Some of the important classifications are as follows:

The pioneer workers in this field are Coulter and Chamerlain (1917) divided the gymnosperms directly into seven orders viz.

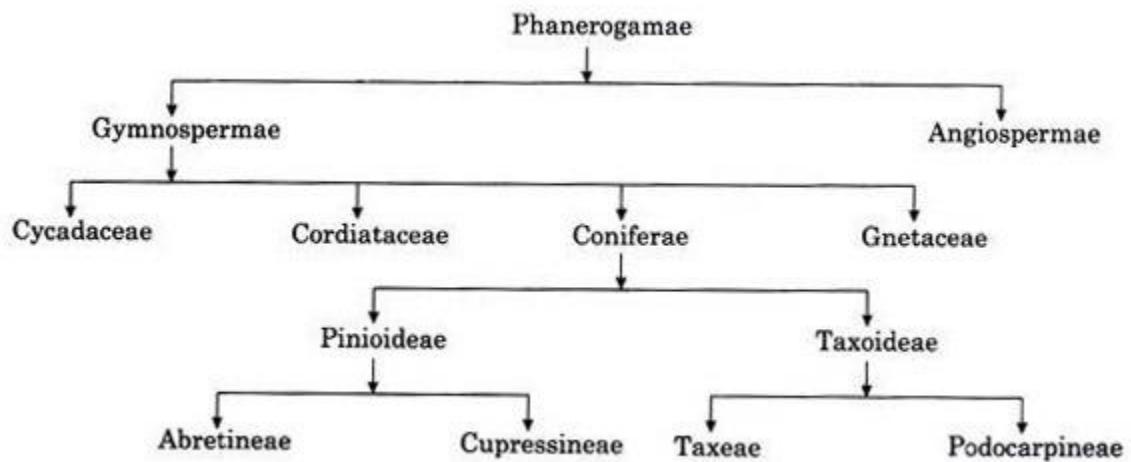

1. Cycadofilicales
2. Bennettitales
3. Cycadales
4. Cordaitales
5. Ginkoalea
6. Coniferales
7. Gnetales

Van Tieghem (1898) treated gymnosperms as one of the two divisions of Spermatophyta and further divided it as follows:

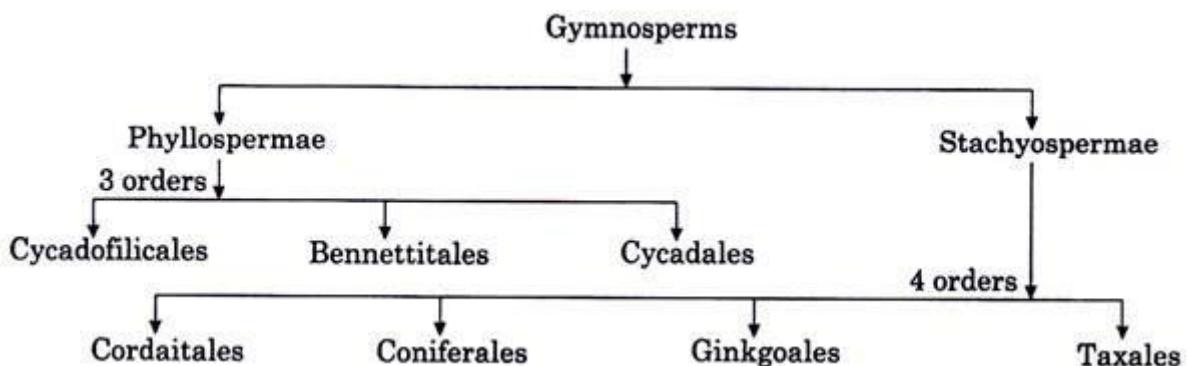

Eichier (1883) considered gymnosperms as one of the two divisions under Phnanerogamae. The second division is Angiospermae.

Eicher (1889) classified the seed plants as:

Birbal Sahni (1920) divided the gymnosperms into two divisions:

Taylor (1981) divided the gymnosperms into six divisions:

Division 1. Progymnospermophyta

Division 2. Pteridospermophyta

Division 3. Cycadophyta

Division 4. Cycadeoidophyta

Division 5. Ginkgophyta

Division 6. Coniferophyta

Gifford and Foster (1989) raised the important groups to the rank of division.

Division	Gymnosperms	
<b>Div. 1. Progymnospermophyta</b>		Geological Time Middle Devonian to lower carboniferous
Orders	Aneurophytales      Archaeopteridales	
<b>Div. 2. Pteridospermophyta</b>		Carboniferous to permian Permian to Triassic (Glossoptridales) Triassic to Cretaceous (Caytoniales)
Orders	Glossoptridales      Caytoniales	
<b>Div. 3. Cycadophyta order cycadales</b>		Permian to recent
<b>Div. 4. Cycadeoidophyta order Cycadeoidales</b>		Triassic to Cretaceous
<b>Div. 5. Ginkgophyta order Ginkgoales</b>		Triassic to recent
<b>Div. 6. Coniferophyta</b>		Upper Carboniferous to permian Upper Carboniferous to permian (Cordaitales) Upper carboniferous to Jurassic (voltzales) Triassic to recent (coniferales)
Orders	Cordaitales      Voltziales      Coniferales	
<b>Div. 7. Gnetophyta</b>		Permian (?) to recent
Orders	Ephediales      Gnetales      Welwitschiales	

Recently in 2011, new classification and linear sequence of extant (still existing) gymnosperms based on previous molecular and morphological, phylogenetic and other studies was proposed by Maarten J.M., Christenhusz and co-workers.

It is as follows:

**Sub-class I. Cycdidae:**

order A. Cycadales

Family 1. Cycadaceae

1 genus, 107 species e.g. *Cycas*

Family 2. Zamiaceae

9 genera, 206 species e.g. *Zamia*, *Microcycas* ec.

**Sub-class II. Ginkgoidae:**

Order B. Ginkgoales

Family 3. Ginkgoaceae

1 genus, 1 extant species e.g., *Ginkgo*

**Sub-class III. Gnetidae:**

Order C. Welwitschiales

Family 4. Welwitschiaceae 1 genus, 1 species *Welwitschia*

Order D. Gnetales

Family 5. Gnetaceae

1 genus, 30 species e.g. *Gnetum* Order E. Ephedrales

Family 6. Ephedraceae

1 genus, 40 species e.g., *Ephedra*

**Sub-class IV Pinidae:**

Order F. Pinales

Family 7. Pinaceae

II genera 225 species e.g. *Cedrus*, *Pinus*, *Picea* etc

**Order G. Araucariales:**

Family 8 Araucariaceae 3 genera, 41 species, e.g. *Araucaria*

Family 9. Podocarpaceae 19 genera 180 species e.g. *Phyllocladus*, *Halocarpus* etc.

**Order H. Cupressales:**

Family 10. Sciadopityaceae

1 genus, 1 species e.g. *sciadopitys*

Family 11.

Cupressaceae 29 genera

130 species e.g. *Cunninghamia*, *Cupressus* etc.

Family 12. Taxaceae

6 genera 28 species e.g., *Austrotaxus*, *Pseudotoxus* etc.
